**NEW QUESTION: 1**
After a recent breach, the security administrator performs a wireless survey of the corporate network. The security administrator notices a problem with the following output:
MAC SSID ENCRYPTION POWER BEACONS
00:10:A1:36:12:CC MYCORP WPA2 CCMP 60 1202
00:10:A1:49:FC:37 MYCORP WPA2 CCMP 70 9102
FB:90:11:42:FA:99 MYCORP WPA2 CCMP 40 3031
00:10:A1:AA:BB:CC MYCORP WPA2 CCMP 55 2021
00:10:A1:FA:B1:07 MYCORP WPA2 CCMP 30 6044
Given that the corporate wireless network has been standardized, which of the following attacks is underway?
**A.** DDoS
**B.** Evil twin

**C.** IV attack
**D.** Rogue AP
**Answer: B**
Explanation:
The question states that the corporate wireless network has been standardized. By 'standardized' it means the w ireless network access points are running on hardware from the same vendor. We can see this from the MAC addresses used. The first half of a MAC address is vendor specific. The second half is network adapter specific. We have four devices with MAC addresses that start with 00:10:A1.
The "odd one out" is the device with a MAC address starting FB:90:11. This device is from a different vendor. The SSID of the wireless network on this access point is the same as the other legitimate access points. Therefore, the access point with a MAC address starting FB:90:11 is impersonating the corporate access points. This is known as an Evil
Twin.
An evil twin, in the context of network security, is a rogue or fake wireless access point (WAP) that appears as a genuine HOTSPOT offered by a legitimate provider.
In an evil twin attack, an eavesdropper or hacker fraudulently creates this rogue
HOTSPOT to collect the personal data of unsuspecting users. Sensitive data can be stolen by spying on a connection or using a phishing technique.
For example, a hacker using an evil twin exploit may be positioned near an authentic Wi-Fi access point and discover the service set identifier (SSID) and frequency. The hacker may then send a radio signal using the exact same frequency and SSID. To end users, the rogue evil twin appears as their legitimate
HOTSPOT with the same name.
In wireless transmissions, evil twins are not a new phenomenon. Historically, they were known as honeypots or base station clones. With the advancement of wireless technology and the use of wireless devices in public areas, it is very easy for novice users to set up evil twin exploits.
Incorrect Answers:
B. An initialization vector is a random number used in combination with a secret key as a means to encrypt data. This number is sometimes referred to as a nonce, or "number occurring once," as an encryption program uses it only once per session.
An initialization vector is used to avoid repetition during the data encryption process, making it impossible for hackers w ho use dictionary attack to decrypt the exchanged encrypted message by discovering a pattern. This is known as an
IV attack. This is not what is described in this question.
C. A rogue access point is a wireless access point that has either been installed on a secure company network without explicit authorization from a local network administrator, or has been created to allow a hacker to conduct a man-in-

the-middle attack. Rogue access points of the first kind can pose a security threat to large organizations with many employees, because anyone with access to the premises can install (maliciously or non-maliciously) an inexpensive w ireless router that can potentially allow access to a secure network to unauthorized parties. Rogue access points of the second kind target networks that do not employ mutual authentication (client-server server-client) and may be used in conjunction with a rogue RADIUS server, depending on security configuration of the target network. The Evil
Twin in this question is a type of rogue access point. However, as the access point is impersonating the corporate network, it is classed as an Evil Twin.
D. A distributed denial-of-service (DDoS) attack occurs when multiple systems flood the bandwidth or resources of a targeted system, usually one or more web servers. Such an attack is often the result of multiple compromised systems
(for example a botnet) flooding the targeted system with traffic. When a server is overloaded with connections, new connections can no longer be accepted. The major advantages to an attacker of using a distributed denial-of-service attack are that multiple machines can generate more attack traffic than one machine, multiple attack machines are harder to turn off than one attack machine, and that the behavior of each attack machine can be stealthier, making it harder to track and shut down. These attacker advantages cause challenges for defense mechanisms. For example, merely purchasing more incoming bandwidth than the current volume of the attack might not help, because the attacker might be able to simply add more attack machines. This after all will end up completely crashing a website for periods of time. This is not what is described in this question.

**NEW QUESTION: 2**
You are monitoring a Microsoft Azure SQL Database.
The database is experiencing high CPU consumption.
You need to determine which query uses the most cumulative CPU.
How should you complete the Transact-SQL statement? To answer, drag the appropriate Transact-SQL segments to the correct locations. Each Transact-SQL segment may be used once, more than one or not at all.
You may need to drag the split bar between panes or scroll to view content.

**Answer:**
Explanation:

Explanation

Box 1: sys.dm_exec_query_stats
sys.dm_exec_query_stats returns aggregate performance
statistics for cached query plans in SQL Server.
Box 2: highest_cpu_queries.total_worker_time DESC
Sort on total_worker_time column
Example: The following example returns information about the
top five queries ranked by average CPU time.
This example aggregates the queries according to their query
hash so that logically equivalent queries are grouped by their
cumulative resource consumption.
USE AdventureWorks2012;
GO
SELECT TOP 5 query_stats.query_hash AS "Query Hash",
SUM(query_stats.total_worker_time) /
SUM(query_stats.execution_count) AS "Avg CPU Time",
MIN(query_stats.statement_text) AS "Statement Text" FROM
(SELECT QS.*, SUBSTRING(ST.text, (QS.statement_start_offset/2)
+ 1, ((CASE statement_end_offset WHEN -1 THEN
DATALENGTH(ST.text) ELSE QS.statement_end_offset END
- QS.statement_start_offset)/2) + 1) AS statement_text
FROM sys.dm_exec_query_stats AS QS
CROSS APPLY sys.dm_exec_sql_text(QS.sql_handle)as ST) as
query_stats
GROUP BY query_stats.query_hash
ORDER BY 2 DESC;

**NEW QUESTION: 4**
Adam works as a Security Analyst for Umbrella Inc. He is
retrieving large amount of log data from various resources such
as Apache log files, IIS logs, streaming servers, and some FTP

servers. He is facing difficulty in analyzing the logs that he has retrieved. To solve this problem, Adam decides to use AWStats application. Which of the following statements are true about AWStats?
Each correct answer represents a complete solution. Choose all that apply.
**A.** It can analyze log files server tools such as Apache log files, WebStar, IIS and other Web, proxy, and some ftp servers.
**B.** It generates advanced Web, streaming, mail server statistics graphically.
**C.** It can work with all Web hosting providers, which allow Perl, CGI and log access.
**D.** It works only as a CGI and shows all possible information contained in log.
**Answer: A,B,C**
