NEW QUESTION: 4
You are implementing a package management solution for a
Node.js application by using Azure Artifacts.
You need to configure the development environment to connect to
the package repository. The solution must minimize the
likelihood that credentials will be leaked.
Which file should you use to configure each connection? To
answer, drag the appropriate files to the correct connections.
Each file may be used once, more than once, or not at all. You
may need to drag the split bar between panes or scroll to view
content NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation:
All Azure Artifacts feeds require authentication, so you'll
need to store credentials for the feed before you can install
or publish packages. npm uses .npmrc configuration files to
store feed URLs and credentials. Azure DevOps Services
recommends using two .npmrc files.
Feed registry information: The .npmrc file in the project
One .npmrc should live at the root of your git repo adjacent to
your project's package.json. It should contain a "registry"
line for your feed and it should not contain credentials since
it will be checked into git.
Credentials: The .npmrc file in the user's home folder
On your development machine, you will also have a .npmrc in
$home for Linux or Mac systems or $env.HOME for win systems.
This .npmrc should contain credentials for all of the

registries that you need to connect to. The NPM client will look at your project's .npmrc, discover the registry, and fetch matching credentials from $home/.npmrc or $env.HOME/.npmrc.
