NEW QUESTION: 1
An organization currently using tape backups takes one full backup weekly and incremental backups daily.
They recently augmented their tape backup procedures with a backup-to- disk solution. This is appropriate because:
A. data storage on disks is more reliable than on tapes.
B. fast synthetic backups for offsite storage are supported.
C. backup to disk is always significantly faster than backup to tape.
D. tape libraries are no longer needed.
Answer: B
Explanation:
Explanation/Reference:
Explanation:

Disk-to-disk (D2D) backup should not be seen as a direct replacement for backup to tape; rather, it should be viewed as part of a multitier backup architecture that takes advantage of the best features of both tape and disk technologies. Backups to disks are not dramatically faster than backups to tapes in a balanced environment. Most often than not there is hardly a difference, since the limiting components are not tape or disk drives but the overall sustained bandwidth of the backup server's backplane. The advantage in terms of speed is in restoring performance, since all data are on hand and can be accessed randomly, resulting in a dramatic enhancement in throughput. This makes fast synthetic backups (making a full back up without touching the host's data only by using the existing incremental backups) efficient and easy.
Although the cost of disks has been reduced, tape-based backup can offer an overall cost advantage over disk-only solutions. Even if RAID arrays are used for D2Dstorage, a failed drive must be swapped out and the RAID set rebuilt before another disk drive fails, thus making this kind of backup more risky and not suitable as a solution of last resort. In contrast, a single tape drive failure does not produce any data loss since the data resides on the tape media. In a multidrive library, the loss of the use of a single tape drive has no impact on the overall level of data protection. Conversely, the loss of a disk drive in an array can put all data at risk. This in itself reinforces the benefits of a disk-to-disk-to-any storage hierarchy, as data could be protected by a tertiary stage of disk storage and ultimately tape. Beyond the drive failure issue, tape has an inherent reliability advantage over any disk drive as it has no boot sector or file allocation table that can be infected or manipulated by a virus.

NEW QUESTION: 3
A custom network ACL that you create _____ until you add rules, and is not associated with a sub-net until you explicitly associate it with one.
A. allows outbound traffic by default
B. allows all inbound and outbound traffic by default
C. blocks only inbound traffic by default
D. blocks all inbound and outbound traffic by default

Answer: D
Explanation:
Explanation/Reference:
Explanation:
You can create a custom network ACL for your VPC. By default, a network ACL that you create blocks all inbound and outbound traffic until you add rules, and is not associated with a subnet until you explicitly associate it with one.
The default NACL that is created with your VPC allows all inbound and outbound traffic by de-fault.
