Explanation:

Under normal network operating conditions, the vast majority of packets handled by network devices are
data plane packets. These packets are handled in the fast path. Network devices are optimized to handle
these fast path packets efficiently. Typically, considerably fewer control and management plane packets
are required to create and operate IP networks. Thus, the punt path and route processor are significantly
less capable of handling the kinds of packets rates experienced in the fast path since they are never
directly involved in the forwarding of data plane packets
