It is very convenient for you to use the online version of our H13-723 real test.

NEW QUESTION: 1

HOTSPOT

You need implement tools at the client's location for monitoring and deploying Azure resources.

Which tools should you use? To answer, select the appropriate on-premises tool for each task in the answer area.

Answer :

Explanation:

Explanation:

* System Center Virtual Machine Manager (SCVMM) enables rapid provisioning of new virtual machines by the administrator and end users using a self-service provisioning tool.

* System Center Operations Manager (SCOM) is a cross-platform data center management system for operating systems and hypervisors. It uses a single interface that shows state, health and performance information of computer systems. It also

provides alerts generated according to some availability, performance, configuration or security situation being identified.

The basic idea is to place a piece of software, an agent, on the computer to be monitored.

The agent watches several sources on that computer, including the Windows Event Log, for specific events or alerts generated by the applications executing on the monitored computer.

* Scenario:

Leverage familiarity with Microsoft server management tools.

Manage hosted resources by using on-premises tools.

Mitigate the need to purchase additional tools for monitoring and debugging.

Use advanced monitoring features and reports of workloads in Azure by using existing Microsoft tools.

NEW QUESTION: 2

Your company has a main office and two branch offices. The main office is located in New York. The branch offices are located in Seattle and Chicago.

The network contains an Active Directory domain named contoso.com. An Active Directory site exists for each office. Active Directory site links exist between the main office and the branch offices. All servers run Windows Server 2012 R2. The domain contains three file servers. The file servers are configured as shown in the following table.

You implement a Distributed File System (DFS) replication group named ReplGroup.

ReplGroup is used to replicate a folder on each file server.

ReplGroup uses a hub and

spoke topology. NYC-SVR1 is configured as the hub server.

You need to ensure that replication can occur if NYC-SVR1 fails.

What should you do?

A. Modify the properties of ReplGroup.

B. Create a connection in ReplGroup.

C. Create an Active Directory site link bridge.

D. Create an Active Directory site link.

Answer: B

Explanation:

Unsure about this answer.

D:

A: The Bridge all site links option in Active Directory must be enabled. (This option is available in the Active Directory Sites and Services snap-in.) Turning off Bridge all site links can affect the ability of DFS to refer client computers to target computers that have the least expensive connection cost.

An Intersite Topology Generator that is running Windows Server 2003 relies on the Bridge all site links option being enabled to generate the intersite cost matrix that DFS requires for its site-costing functionality. If you turn off this option, you must create site links between the Active Directory sites for which you want DFS to calculate accurate site costs. Any sites that are not connected by site links will have the maximum possible cost. For more information about site link bridging, see "Active Directory Replication Topology Technical Reference."
